

**ProCo,
Sheffield**

Case Study

The ProCo Print factory in Sheffield is a busy print production facility, with both traditional litho printing and the latest digital printing equipment. This uses 'state of the art' machinery from Hewlett Packard, which operates in a strictly clean environment, with no dust or dirt allowed. However the floors are also subjected to heavy foot, pallet truck and fork lift traffic, which are occurring almost continuously.

Therefore the factory had to have just the right sealed, easily cleaned and hard wearing flooring system, to prevent any future problems or costly downtime.

ProCo looked for the solution with Corze NE specialist contractors and consulted their materials specialists **NCC**, for advice and guidance in selecting the system.

NCC immediately saw this as an ideal application for the Sikafloor 261 system. This is a self levelling, epoxy resin based floor which is extremely hard wearing and easy to clean.

ProCo and the engineers from Hewlett Packard found this perfect. Jon Bailey at ProCo now says "We are delighted and would not hesitate to recommend this to anyone."
