

Irish Country Gold Flavours and Essences, Blackburn

Case Study

Irish Country Gold Flavours and Essences are market leaders in their field for the food and many other industries. At their Blackburn production plant their engineers wanted a hard wearing, chemically resistant and easily cleaned floor for the new chemical processing and storage areas at the facility.

The new resin floor finishes had to provide a surface that was not only chemically and mechanically resistant, but almost to 'Cleanroom' environmental standards in hygiene and ease of cleaning, in order to meet the owners stringent performance requirements throughout.

Following NCC's advice and then the proven results from Phase 1 of their new buildings programme, the plant engineers had no hesitation in consulting NCC once again. A high performance polyurethane resin screed from Sika was used for precise coving around detailing works, with a Sika epoxy resin based, self-levelling floor system to provide durable and easy to clean surfaces, including the logistics areas.

NCC was also able to introduce a competent and experienced contractor to complete the works which were all carried out by P J McGrath and Sons Ltd.

Client:

Irish Country Gold
Flavours and Essences

Specialist Contractor:

PJ McGrath and Sons LTD

Products Used:

Sika Resin Floor Systems
