

Pall Mall Car Park Liverpool

Case Study

Tynedale Specialist Flooring Contractors of Knutsford in Cheshire have completed the installation of a Sikafloor deck surfacing system, on the exposed top deck and ramps, at the Pall Mall car park structure in central Liverpool. This was carried out for the car park owners Bruntwood Estates, who are a commercial property development and management company, focussed on providing high quality serviced office facilities in the North of England, which is why their car park is managed by NCP.

NCC provided an elastic, crack bridging and UV light resistant, PU resin based deck waterproofing system from Sika for use on all the top decks and ramps, as they are subject to external weathering and therefore the greatest thermal movement.

An alternative solution with a very tough, epoxy resin based, deck coating system, was recommended by NCC for use on the lower decks and ramps, because of the extremely high abrasion and wear resistance required.

Anti-skid and anti-slip finishes were incorporated into both system surfaces by using graded, specially hardened aggregates that were broadcast into them. Finally the demarcation zone and lane markings were applied.
